A burndown chart shows the amount of work remaining in a sprint over time. The ideal guideline represents the expected rate of progress, while the actual progress line shows how quickly the team is completing work. A downward trend indicates that the remaining workload is decreasing.

1. What went well?

The highest-priority vaccination scheduling functionality was completed first. The backlog was organized according to business value, and the stories were estimated using Fibonacci-based story points.

2. What was challenging?

Dose eligibility and vaccination booking were relatively complex because they involve multiple business rules, including cohort eligibility, dose intervals and real-time slot availability.

3. What did the burndown chart show?

The burndown chart showed decreasing remaining work as stories were moved from To Do to In Progress and finally Done.

4. What could be improved?

Future sprints could use historical velocity from completed sprints to improve planning accuracy and avoid overcommitting to work.

5. What was learned?

The exercise demonstrated how requirements can be transformed into Agile Epics and User Stories, estimated with Story Points, prioritized, planned into Sprints and tracked using a Scrum board and Burndown Chart.
